

## Basic Test Equipment

I had a Variac for years that I used when working on old radio equipment but it was never in an enclosure. When it was used I always had to use jumper wires to connect everything together. I recently got around to packaging it as shown below. The photos also include some basic equipment that I might use with the Variac. These are an isolation transformer (one to one ratio) that is handy when working on AC/DC "All American Five" type radios and an incandescent bulb type AC current limiter. Details on the AC current limiter are [here](#).
